

Home Sweet Comfortable Home

Fans and Air Circulators Can Deliver up to 20% Savings Off Energy Bills www.HoneywellFanSavings.com

Find out how running fans and air circulators during both the summer and winter months can improve overall air circulation and help save you money at www.HoneywellFanSavings.com.

This summer there is no need to blast your air conditioner. By running a fan to improve air circulation along with your home cooling system and adjusting your thermostat by a few degrees to conserve electricity, you can save cold cash while staying cool! The website can also show you how fans and air circulators can be used year-round with the central heating system to improve heat distribution throughout your room during fall and winter months.

To compare the cost of cooling your home as you normally do versus the savings generated by using an air circulator to distribute cooling throughout your house, visit www.HoneywellFanSavings.com. This new innovative website features an interactive calculator for you to make your own personal comparisons. For example, the seasonal cost to cool one room using an air conditioning unit is about \$95 compared to \$4 to run one whole room air circulator. By adjusting the thermostat just five degrees, you can save up to \$19.80 per room, per season without sacrificing cooling comfort.

Savings Calculator-- How it Works:

Simply log on to the calculator and follow these four easy steps:

- 1) Select the number of rooms you would like to cool
- 2) Set the first thermostat to your usual standard cooling temperature in your home
- 3) Adjust the second air conditioner thermostat to a higher setting so you use less electricity
- 4) Select the state you live in to calculate savings based on the new temperature adjustment
